

NEXT LEVEL PAM: FUDO AND SPARKVIEW THE BEST HTML5 REMOTE-DESKTOP-CLIENT FOR FUDO

**BEYOND
SSL**

PAM ON A NEW LEVEL

► Privileged Access Management Appliance

Fudo is a Privileged Access Management (PAM) appliance which allows full control over remote sessions. Tracking live sessions with a browser, adding an administrator to the session or the proactive monitoring including the automatic termination of a running connection – the Fudo PAM offers many functions. Additionally, the solution includes a business tool for the measurement of a user's productivity and hour-long sessions can be scanned within seconds via full-text search. The Fudo PAM is a GDPR-compliant appliance that closes the security gap in many businesses, while offering an added value. Supported protocols include SSH, Telnet, RDP, VNC, Oracle, MySQL, HTTP(S), Modbus and many more.

► Additional benefits of the technology leader Fudo:

- Interface independence
- Fast installation (only one day)
- Flexible, intuitive, scalable
- No player or plug-in needed
- Central Secure-Access-Gateway without a VPN-Client
- All-inclusive package, no hidden costs, all-in-one license
- Fast proof-of-concept installation

► Supercharged Fudo PAM with SparkView

To further enhance the flexibility of the Fudo PAM, it can be combined with the secure remote access solution SparkView. Why?

It's that simple: Since Fudo was designed for the highly privileged access of administrators, the technology of SparkView is needed to allow ALL users to experience their familiar functions of their native client (e.g. MSTSC, Putty) via pure HTML5. To realize BYOD-scenarios fast and simple and still guarantee for strong security, the secure remote access solution SparkView can be connected upstream. SparkView translates the HTML5 protocol into a for the Fudo PAM readable protocol, like RDP or VNC. SparkView works with any browser, no VPN-client has to be installed and everything runs via one server. Complex software rollouts simply lapse completely and the client support is reduced to an absolute minimum. Moreover, local printing and the integration of network drives is possible without additionally having to install a driver.

► A harmonic team

When combining Fudo and SparkView, not only all benefits of both solutions remain, but they further enhance and complement each other. While SparkView stands for a complete secure remote access solution, Fudo records the protocol raw data (mandatory in KRITIS) and allows for a fast analysis of the existing activities (e.g. session playback, analysis of efficiency, intelligent search options for input commands). Due to the separate licensing of each solution, no compromises have to be made whilst having full cost control. Fudo needs to be installed on 20 servers, but you need 2000 concurrent users in SparkView? No problem, you only pay for what you actually need.

► Perfect duo for your needs

Together, both solutions are a comfortable, fast, and most important, secure option for businesses and organizations, that need to protect their sensitive data and trade secrets, whilst meeting all criteria for ISO, UpKritis and GDPR.

BENEFITS OF SPARKVIEW

- Secure remote access to applications, desktops and servers from any device via browser
- No installation on clients or target systems
- A central point of administration and authorization
- HTML5-technology
- Flexible, stable and highly scalable
- Very low support effort
- Optional integration of multi-factor authentication
- Supports common protocols like RDP, SSH, Telnet and VNC
- No Java, No Flash, No ActiveX, No Plugin, No Rollout

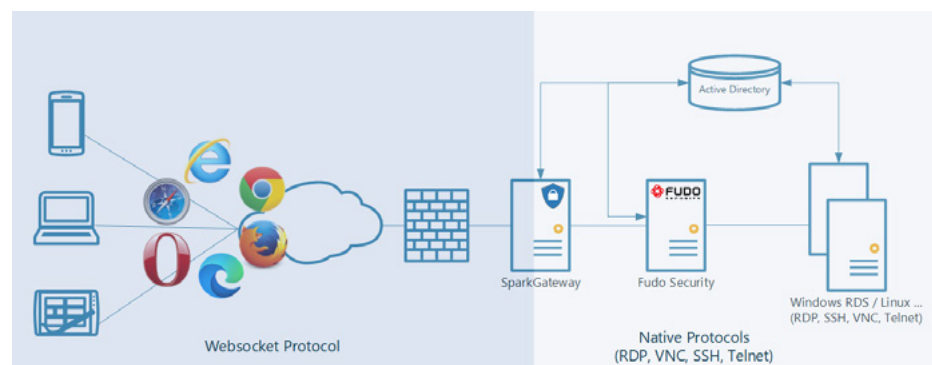

Chart: beyond SSL and Fudo Security

beyond SSL - always a step ahead

Our passion: taking on the IT challenges of today. At beyond SSL we address some of the most pressing issues in the field of information technology. The universal availability of data and applications, the protection from unauthorized access as well as efficient sync and share solutions for confidential information complete our portfolio. The security of your data is our top priority at all times.

SparkView - globally distributed by beyond SSL.
